

Group 3
IT 372-B01
5/29/2026
Professor Azamy
Saukhya Shrestha, Richard Tindell, LK Kalidindi

Step 1:

Audience(LK)	Being safe online has few needed practices that have big cybersecurity companies where they recommend using sturdy and unique passwords and keeping them in a password manger or spreadsheet like excel spreadsheet. Companies like Google and Microsoft talk about the best ways to stop unwanted access and hackers that utilize links and messages that are fake which they can steal login credentials. One of the best ways to keep students information safe is keeping their apps updated and security vulnerabilities that gets patched. A good practice is recommended for example Microsoft Security Tips and NIST which stands for National Institute of Standards and Technology regulation and the limitations of much personal information they share in the public, if people share in public, like oversharing makes it easier for the red hat hackers to guess the passwords and act as the person on the account, which National Cybersecurity Alliance mentioned. Non-technical students should be the audience for this project because they don't have training for this.
Problem (Richard Tindell)	Many non-technical students do not know how to implement simple, effective cybersecurity practices.
Outcome (Richard Tindell)	Agents that can evaluate a person's cybersecurity practices and make recommendations and adjustments to help non-technical people have a more secure presence online.
Constraints: (Saukhya Shrestha)	There are multiple constraints to keep in mind such as prior knowledge, time, and cost. The target audience could have very limited knowledge of technology and not be familiar with best practices. The limited experience would make it difficult to present information in an easily digestible format for all users; thus, the skills of the reader must be kept in mind. Students have busy schedules so there would be limited time to learn complex security practices. Lastly, because the target audience is students, most would prefer a low-cost solution which can be quickly applied.

1-Line Pitch: Making cybersecurity awareness simple to ensure non-technical users can stay safe online through practical digital habits which can be utilized every day.

Niche Keywords:

1. Non-technical student users
2. Practical digital safety
3. Cybersecurity Practices

Step 2 :

LK: The video talked about 10-week AI learning plan which is created to help the learners which is created skills, by finishing the focused on projects. Each of the projects is created tiple abilities, for example, research and knowing how to understand and how AI system functions, which the data that is analyzed. The narrator talked about the hands on which created the habits that are useful long-term.

Saukhya: The video went over a week-by-week plan for the AI project which introduced me to new tools such as Lindy and Make. Beyond learning about new concepts such as vibe coding, my biggest takeaway was the shift I must make on how I view AI. I need to move past the chatbot perspective and view it as what it is: an autonomous agent.

Richard Tindell: I watched the video and I am excited about this 10-week project to learn how to integrate all the AI tools to create a project. The video covered all the 10 weeks and the topics of each project. I have started listening to the daily podcasts and believe this project will help me gain the understanding I need for the work I am doing with AI.

Step 3:

LK- I visited the website and joined AI-DB mission, after I signed in to the website, I looked at big pages that understand the features of the website. I looked at multiple sample projects in the Gallery where there are examples of how the user functions, where it has samples of how different users that made assignments that are based on AI.

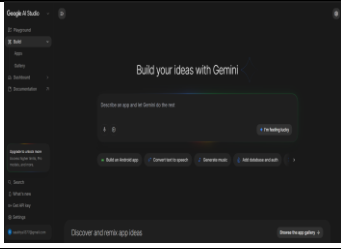

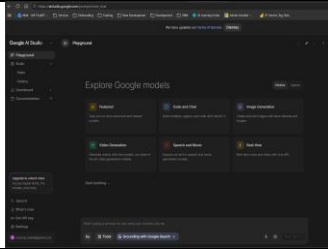

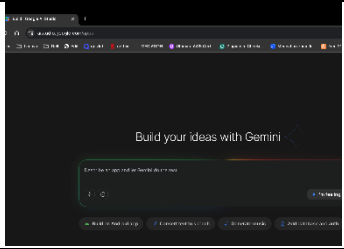

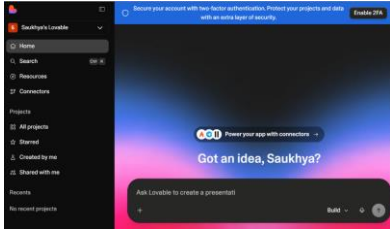

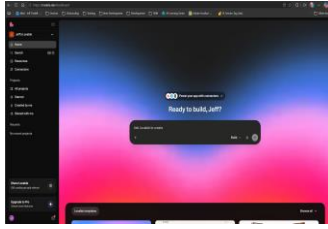

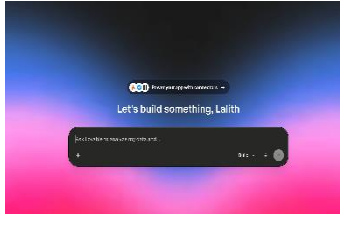

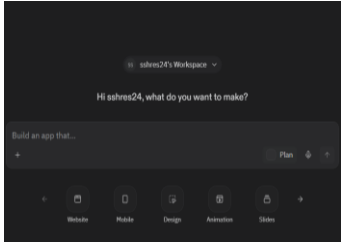

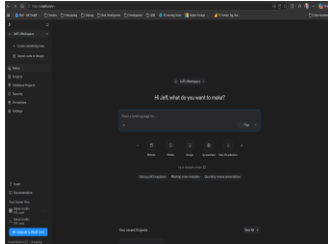

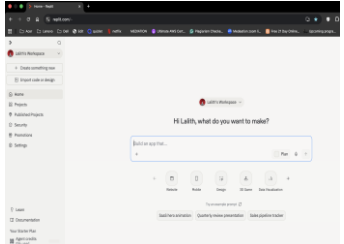

Richard Tindell

- Joined the AI-DB website
- Reviewed the website so that I could understand the content of the website
- Browsed project to understand what we are trying to achieve

Saukhya Shrestha

- Images of the project in the gallery helps to give an idea of what the project could look like
- Within the Gallery, there were logs even if students “failed” in that week; I will be doing this to log the occurrences.
- Resources under each week’s tasks help provide further support on what to use which lessens confusion

Step 4:

Tool	Saukhya Shrestha	Richard Tindell	LK Kalidindi
Google AI Studio			
Lovable			
Replit			
All tools	I have created accounts for all the tools listed.	I have created an account for all the accounts listed.	I have created an account for all the accounts listed.
